Dear Colleagues,

The ACEnet Research Directorate is preparing a Research Profile as part of the Funding Sustainability Initiative of its Strategic Plan. This is a critically important initiative for ACEnet's financial future.

In addition to aggregate quantitative data about the ACEnet users that we already have on record, we would like to include more qualitative anecdotal information that will exemplify impact and success. We are soliciting contributions of a couple of sentences in length from ACEnet users who can provide examples of any of the following:

1. Examples of particularly exciting academic or industrial success based on research programs using ACEnet:
 - especially large or unusual federal or industrial grants
 - prestigious national or international research awards won
 - successful commercialization, industrial partnership, patents or spin-offs
 - equivalent successes
2. Examples of non-traditional research programs using HPC, even if not using ACEnet:
 - programs in medical science, social science, humanities, commerce/finance/economics, etc.
 - programs that rely on data-intensive computing: data mining, informatics, etc.

If you have a story that exemplifies any of these based on your research program, please write up just a couple of sentences with the sorts of details that would leap out of an overall profile, and email them to ian.short@smu.ca. I will take responses as permission to refer to you and your program in the profile.

If you know of someone at your institution in a non-traditional area who has been thinking of taking advantage of HPC, please forward this message to them.

If contributions could arrive by the end of March, that would be ideal.

Thank you. The RD appreciates any assistance from the ACEnet community in making our document compelling for potential partners and supporters.

Ian
