

How would you classify your current usage of parallel computing resources and what do you anticipate using in the next three years?

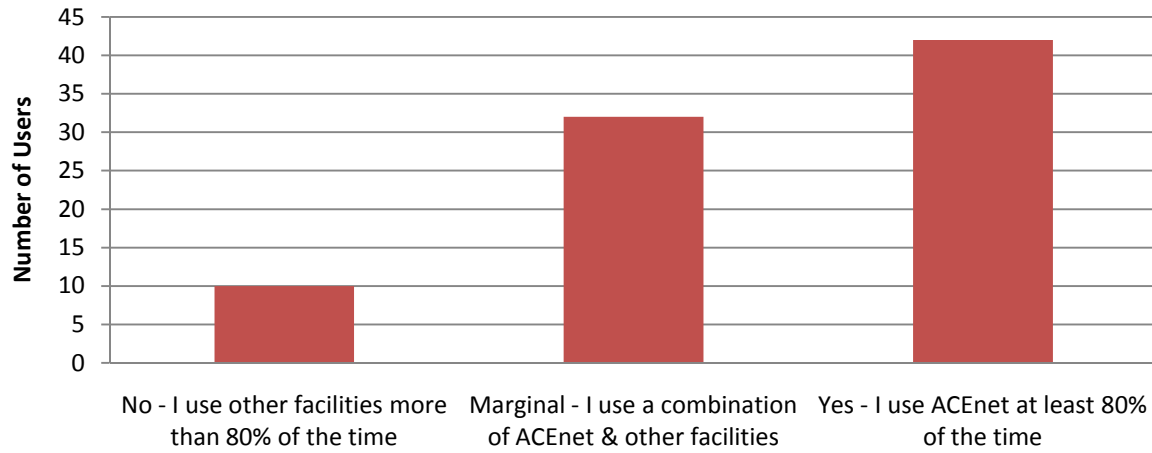

If you use parallel codes a great deal, please classify the nature of the parallelism you use most of the time.

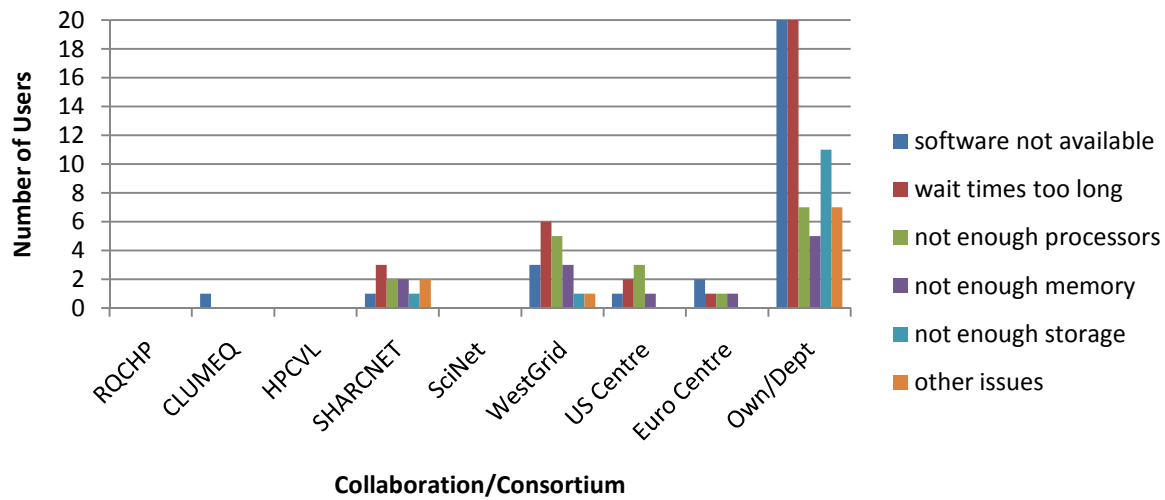

Please estimate approximately how many CPU hours you used across all computing resources (not just ACEnet) available to you over the last year.

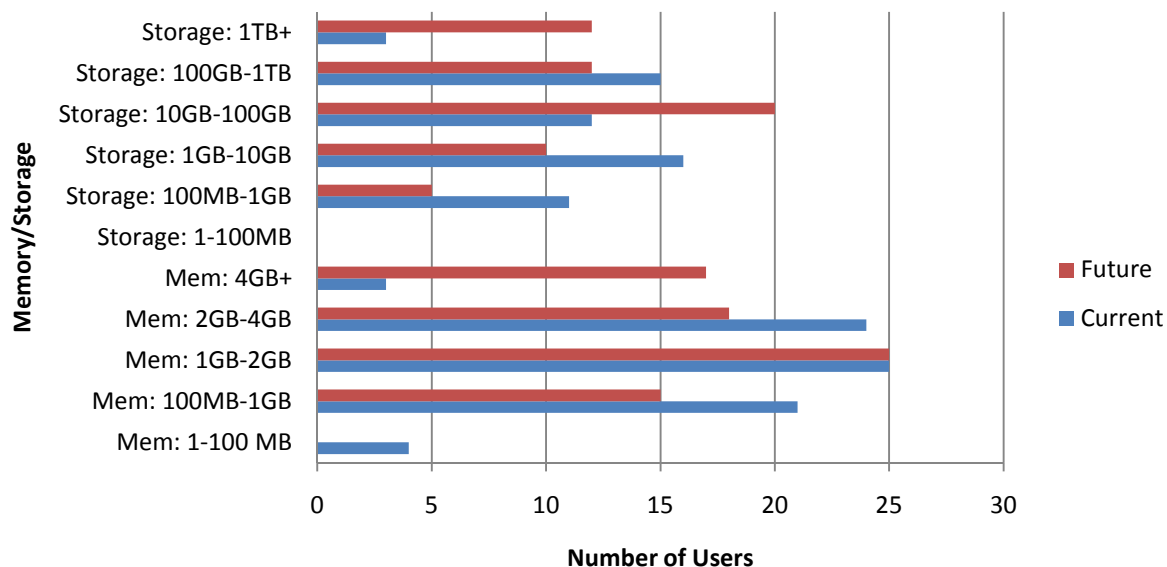

Does ACEnet currently have enough computing resources to meet your research needs?

If ACEnet does not meet your needs, please indicate the reason and which collaboration/consortium you use instead.

Typically, how much memory per processor core (not for your total job) do you require (1st part of question) and how much disk space you need (2nd part).

How would you like ACEnet to proceed in future spending?
